Building an AI Workflow

chadhaswayam@gmail.com

Introducing Today's Project!

In this project, I will demonstrate how to add an event to my calendar just by sending a text to my workflow, which is going to be my AI calendar assistant.

Tools and Techniques

Services I used were n8n Workflows with OpenAI and Google Calendar.

Project reflection

Around an hour

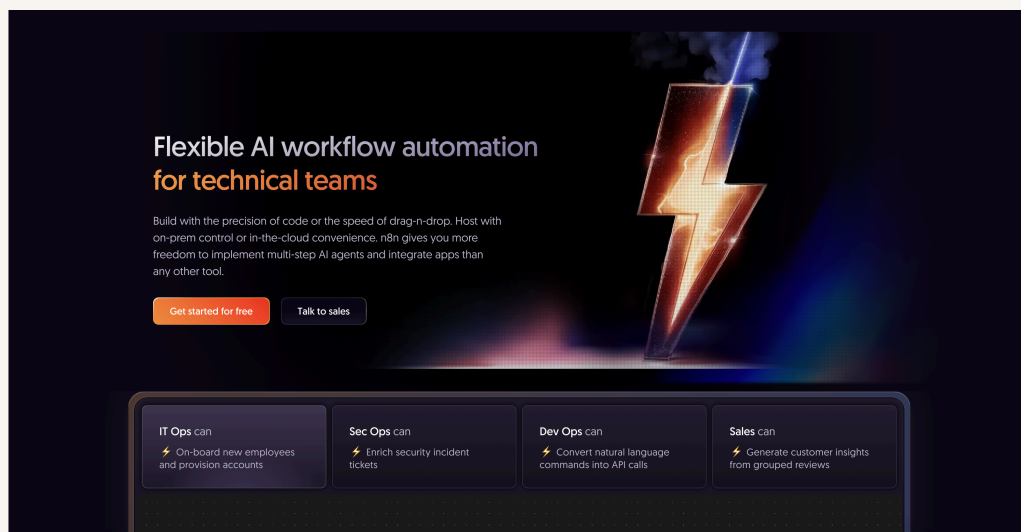

This project met my goals

Exploring n8n

I'm using n8n in this project to automate a task by connecting different applications and setting up how I'll move data between them. You can involve AI in a workflow by using image generation, predictive analytics and generative AI.

I signed up for a free trial for n8n, which includes access to n8n's platform for 14 days, and lets you build up to 5 workflows. I don't need to enter credit card details to start the trial, so I won't be charged.

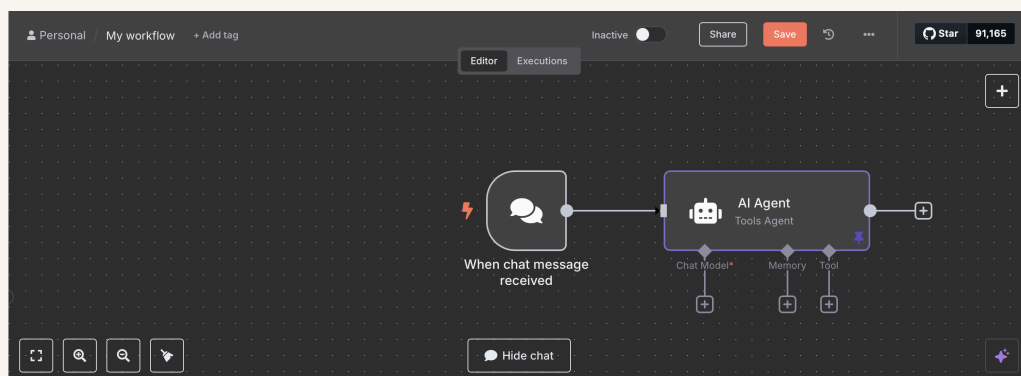

Starting an AI Workflow

To set up a workflow, I first configured a trigger, which is a step that starts my workflow. My trigger is chat messages. Other options include schedule, webhook call or form submissions.

I connected my trigger with an AI agent node. AI Agents are systems that don't need any triggers to act. Agents gather data to decide what to do and act on their own. But, in this project, I am building a trigger i.e. a chat message being sent- AI workflow

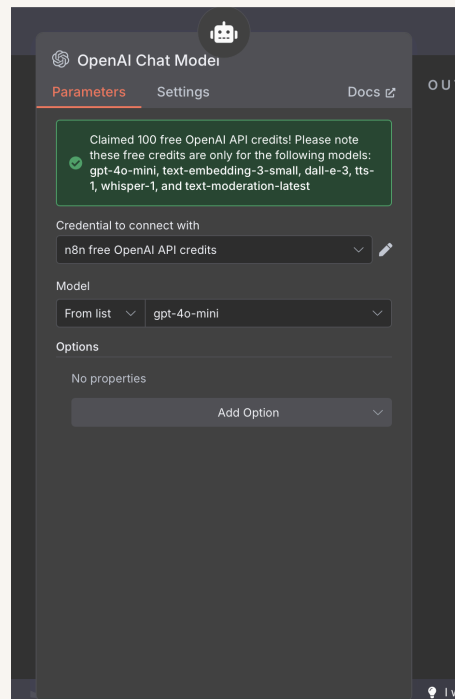

Integrating ChatGPT

An AI workflow can be broken into three key components, which are the chat model, the memory section and the tool section

My workflow's chat model uses OpenAI. Usually, connecting with OpenAI requires access through their API, which means setting up API keys and paying for API requests your workflow makes. I could connect with OpenAI for free by claiming the 100 API credits

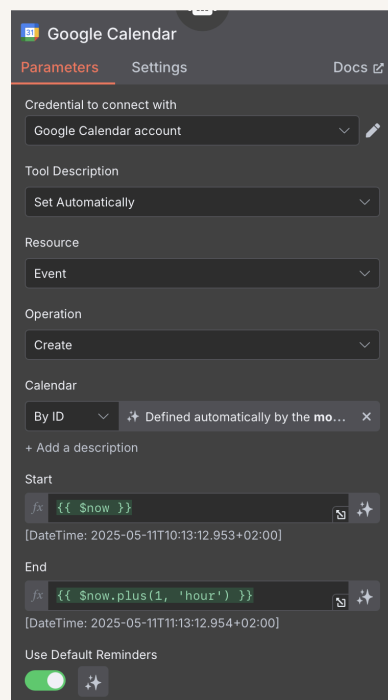

Integrating Google Calendar

In this workflow, the tool is Google Calendar because I want to add calendar access for my AI Agent

To connect with Google Calendar, you have to allow n8n access to view and edit events on all of your calendars and see,edit,share and permanently delete all the calendars you can access through Google Calendar

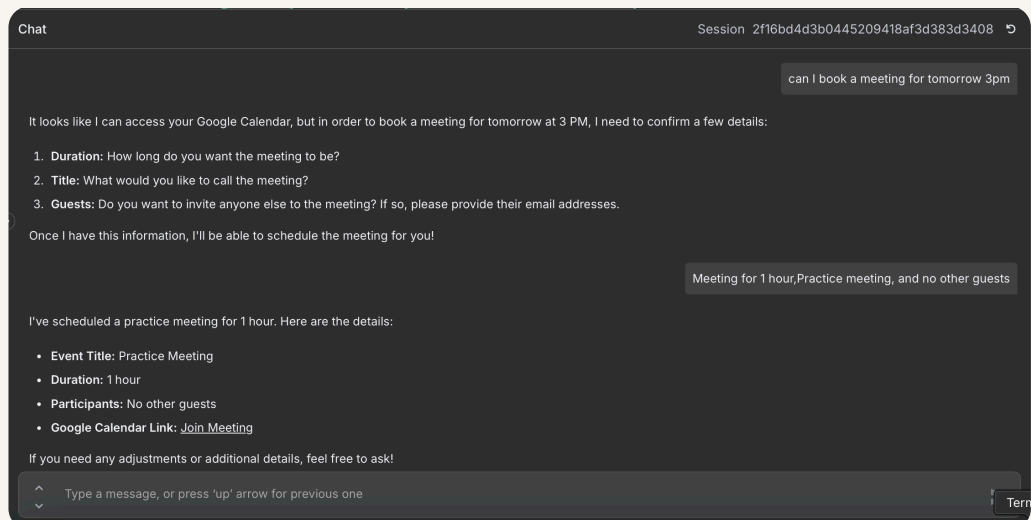

Testing My Workflow

I tested my workflow by trying to schedule a meeting for tomorrow. It asked me for a few more details and then scheduled the meeting successfully.

To troubleshoot errors, you can investigate your AI agent's logs. I observed that the input seems to accurately log your request, but it doesn't seem like there's any output going out of the model.

JSON Expressions

Noerror

I updated the start and end times to troubleshoot

```
Start
fx {{ $fromAI('start_time') }}
undefined

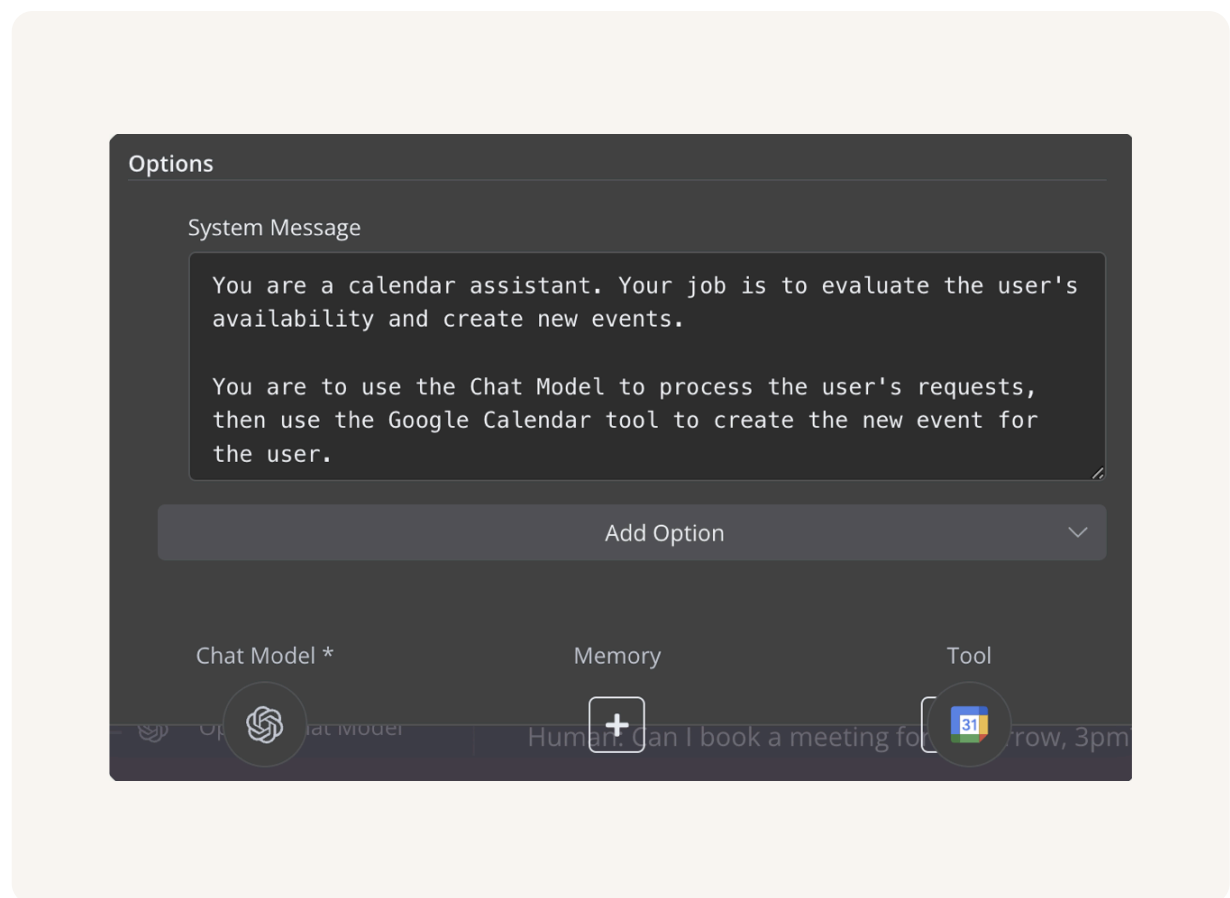

End
fx {{ $fromAI('end_time') }}
undefined
```

System Messages

On my second test, my workflow successfully worked

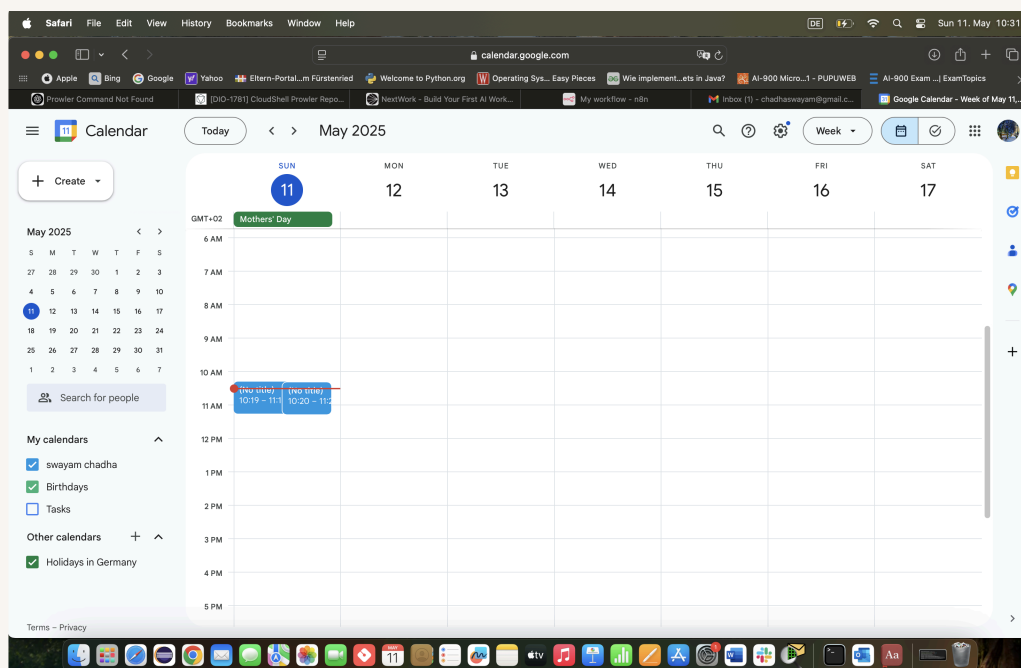

This time, I tried to troubleshoot the error by writing a system message

Success!

On my final test, a new event was scheduled at the right time
